Performance Testing Report
Car Rental Request Automation in ServiceNow

Date	14.10.26
Team ID	ServiceNow - A2
Project Name	Car Rental Request Automation in ServiceNow
Environment	ServiceNow developer instance, Global scope, tested as System Administrator

1. Objective

To check that the car rental request process works end to end and responds within acceptable time: catalog order, approval, task assignment, email notifications and incident creation.

2. Scope and Method

Each scenario was run manually through the Service Portal and the ServiceNow back end, and the result was checked in the Requested Items, Approvals, Catalog Tasks, Emails and Incidents lists. Response times were taken from system timestamps and the flow execution log. No automated load or stress testing was done, so concurrency results are not included.

3. Test Cases and Results

ID	Scenario	Expected result	Observed result	Status
TC-01	Order Car Rental Request from the portal	Request and RITM are created and the order is confirmed	Request submitted; RITM created and listed in Requested Items	Pass
TC-02	Approve the request (Approval = Approved)	Flow continues and a task is created for the Transport Team	Tasks assigned to Transport Team (SCTASK0010006 to 0010008)	Pass
TC-03	Reject the request	Approval shows Rejected; no task is created	Approval record State = Rejected; list shows Rejected (RITM0010006, RITM0010008)	Pass
TC-04	Email notifications	Created, approved, task-assigned and completion emails are sent	All four types appear in the Emails list	Pass
TC-05	Business rule: incident on closed request	Incident is created with the request number	INC0010004 created: Car unavailable for request: RITM0010007	Pass
TC-06	Close the Transport Team task	Flow resumes and the completion email is sent	Completion emails logged (Car rental request completed)	Pass
TC-07	Rejection email (Else branch)	Requester receives a rejection email	Not confirmed in this test run	To verify
TC-08	Form validation and car filter (past dates, long-rental reason, available cars only)	Invalid orders are blocked; only available cars listed	Not confirmed in this test run	To verify
TC-09	Pickup and drop locations in the completion email	Values appear in the email body	Failed on first test; re-test after adding data pills and re-publishing	Re-test
TC-10	Report: requests by approval status	Chart shows Approved, Rejected and Requested	Not confirmed in this test run	To verify

4. Observed Response Times

Measure	Observed	Source
Flow run, approval to completion (Software Req, same structure as Car Req)	8.4 seconds (8,388 ms)	Flow execution log
Notification jobs (send_notifications)	245 ms to 645 ms	Flow execution log
Order created to Request approved email	about 2 seconds (23:11:35 to 23:11:37)	Emails list timestamps
Task creation after approval	within about 1 minute	Catalog Tasks list

The 8.4 second figure comes from the earlier Software Req flow, which Car Req was copied from, so it is a close guide rather than a direct Car Req measurement.

5. Findings

The approval, task assignment, notification and incident steps all worked and responded in seconds. Issues found during testing were configuration errors, not slowness: the approver field did not save at first, the flow was not attached to the catalog item, the email subject has a typo ("completedd"), and the Requested Item Approval column was hidden by default. All were fixed except the email subject and variable values in the email, which should be re-checked.

6. Conclusion

Under single-user testing, the process met its goals: standard request, automatic approval routing, assignment to the Transport Team, notifications and incident logging, with response times in seconds. TC-07 to TC-10 should be completed and marked before submission. A load test with many simultaneous requests was not run.
